

A. Steady-state ploidy

B. Finite-time ploidy and net growth

A overlays: black solid = fitted p_{misseg} mean; black dashed = population-averaged $p_{\text{mis}}(N, O_2)$ mean; white dotted boundary / hatching = weak spectral gap. Arithmetic means across the same 50 q10 optimizer endpoints. A: steady state. B: continuous in vivo; daily threshold-triggered random passage in vitro. Gray dashed: oxygen 0.5%. Growth colors use signed pseudo-log10 ($\sigma = 0.01 \text{ day}^{-1}$; zero centered). Stochastic passage samples on the first eligible integer day; dilution is excluded from growth.
