

Joint-fit adequacy and context-specific fitted functions

Six approved July joint-pair winners. Direct fits are in-sample; across-winner ranges and traces show solution sensitivity, not confidence intervals.

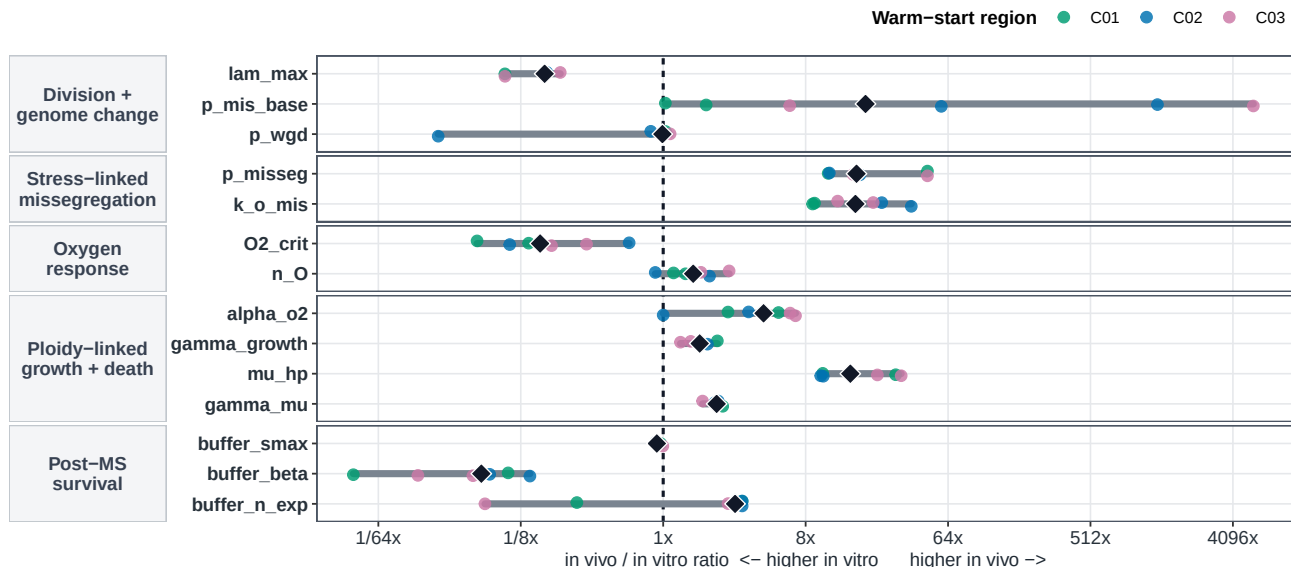

A In-sample fit adequacy

Pale: six selected fits; filled: median. Bars: selected-fit range where legible.

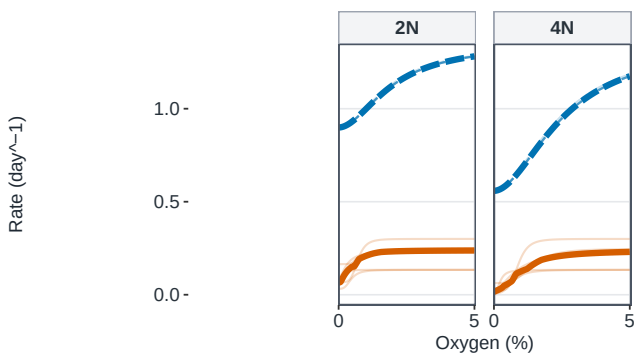

B In-vivo / in-vitro parameter ratios

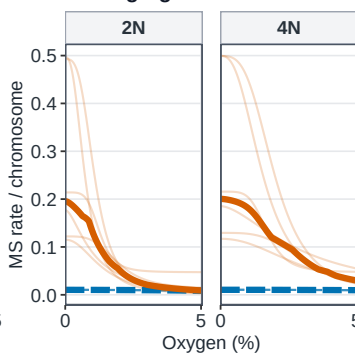

Six values/parameter; gray = range; black diamond = median. Common log2 ratio scale for all 14 coupled parameters.

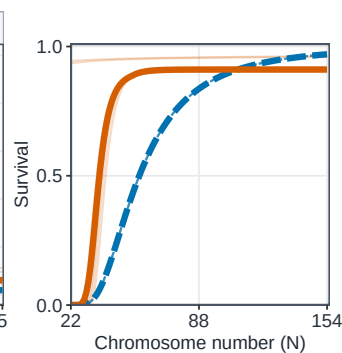

C Proliferation

D Stress-linked missegregation

E Post-missegregation survival

Context — In vivo — In vitro

C-E: thin curves = six fits; thick = pointwise median. Necrosis omitted: predictions unavailable.

B-E use identical six winners; C-D are display-interpolated to a declared 0-5% O2 grid.
