Oxygen-dependent ploidy separation and fitted-landscape parameter structure

500 separate in vivo fitted endpoints embedded with 127,500 retained initial-population rows. All 18 displayed parameters were inputs to the in vivo-only t-SNE.

Heatmap: blue associates higher values with dominant_mean_ploidy < 2; red associates higher values with dominant_mean_ploidy ≥ 2 ; intensity is max(AUC, 1-AUC). Solid full-assignment t-SNE hulls are descriptive fitted-solution summaries, not confidence regions, independent validation, biological subtype boundaries, or causal effects.
