Sobol sensitivity | N4096, five repeats, 201 oxygen points
Cross-scope row order: neighborhood ploidy; each panel retains its own sensitivity annotation.

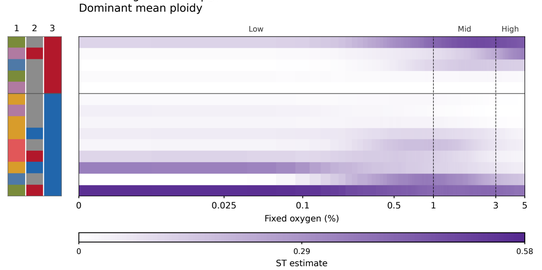

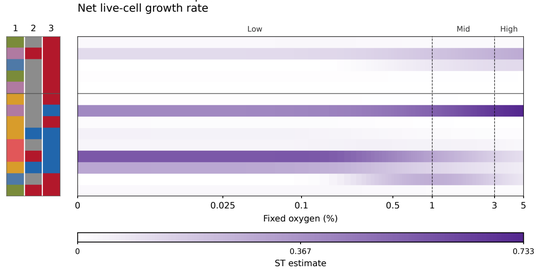

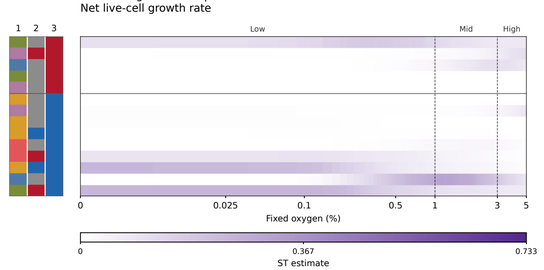

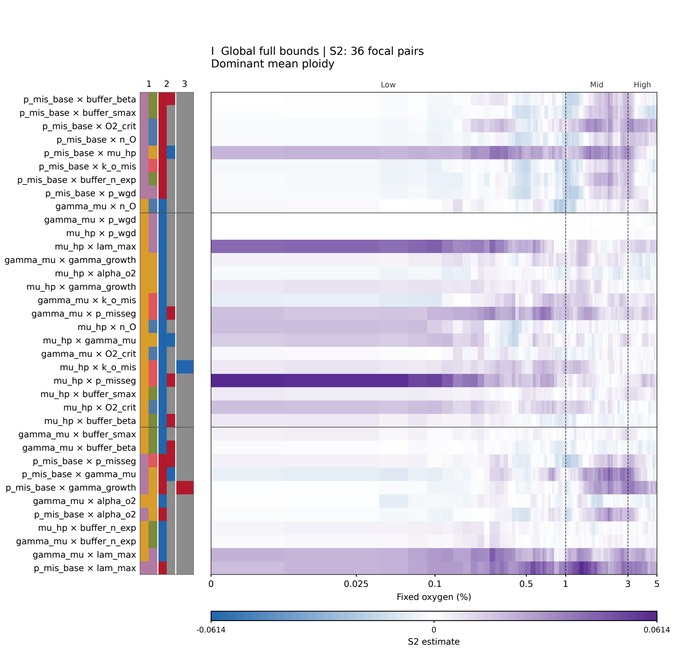

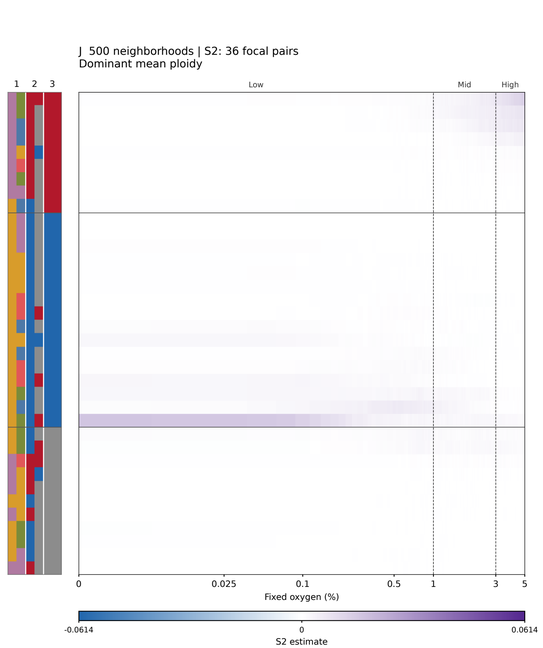

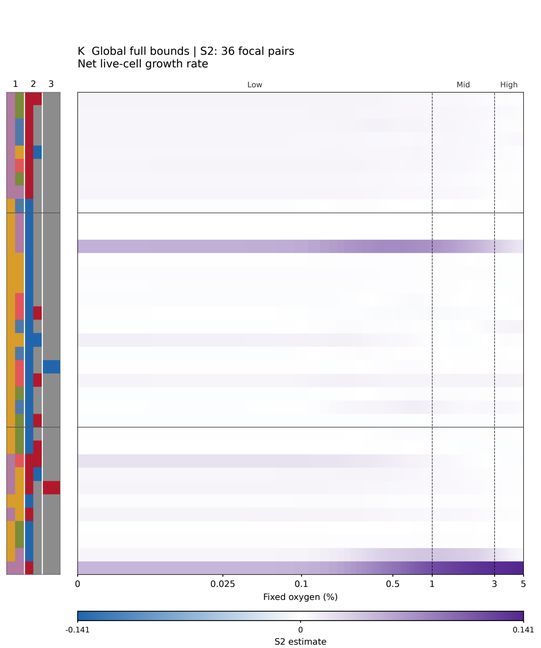

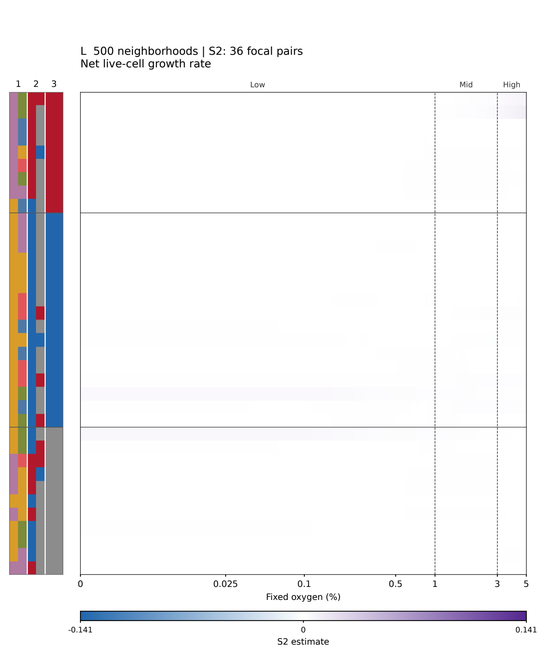

High group: high-$O_2$ score descending; Low group: low-$O_2$ score ascending; unresolved last. No 0.3 sensitivity gate.
S2 annotations 1/2: left/right half = first/second named parameter. Gray = no resolved $O_2$ preference, not no output effect.
Cells: global five-repeat mean; neighborhood median of 500 five-repeat means. No diagnostic exclusions.
$O_2$: $\log_{10}$ above 0.025%; linear from 0 to 0.025% to retain zero. Low: 0–1%; intermediate: >1–<3%; high: 3–5%.

1 Process
Division + genome change
Stress-linked missegregation
Oxygen response
Ploidy-linked growth + death
Post-missegregation survival

2 Figure 4B $O_2$ correlation
3 Sobol $O_2$ sensitivity (ploidy-based)
High $O_2$
Low $O_2$
No resolved $O_2$ preference
